CS 418 - Final Project Rating Analysis and Prediction For Books

Team:

Anusha Voloju Maleeha Ahmed Priyan Sureshkumar

Problem Specification

The goal of this project is to analyse the important factors that make a book more popular and most read compared to others and to use this analysis to predict the average rating of a book and to categorize the books into corresponding genres.

Proposed Solution

The important features are extracted using descriptive statistics and are used to build a regression model for the prediction of average rating of the books.

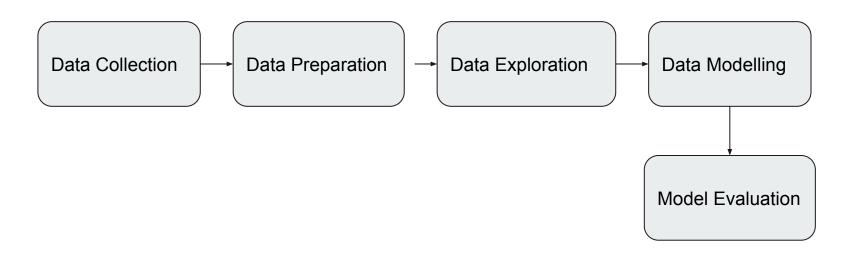

Book Genres

Using classification or clustering techniques, the books are categorized into specific genres.

Data Science Pipeline

Data Collection

We are using Publishers dataset from CORGIS datasets.

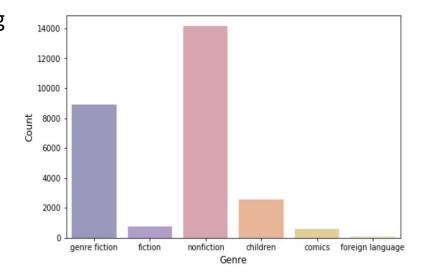

The variables in the dataset include:
genre, sold_by, daily_average_amazon_revenue,
daily_average_author_revenue, daily_average_gross_sales,
daily_average_publisher_revenue, daily_average_units_sold, publisher_name,
publisher type, average rating, sale price, sales rank, total reviews

S.	genre	sold by	daily average.amazon revenue	daily average.author revenue	daily average.gross sales	daily average.publisher revenue	daily average.units sold	publisher.name	publisher.type	statistics.average rating
0	genre fiction	HarperCollins Publishers	6832.000	6832.000	34160.00	20496.000	7000	Katherine Tegen Books	big five	4.57
1	genre fiction	HarperCollins Publishers	2487.500	2487.500	12437.50	7462.500	6250	HarperCollins e- books	big five	4.47
2	genre fiction	Amazon Digital Services, Inc.	9559.000	9559.000	47795.00	28677.000	5500	(Small or Medium Publisher)	small/medium	4.16
3	fiction	Hachette Book Group	8250.000	8250.000	41250.00	24750.000	5500	Little, Brown and Company	big five	3.84
4	genre fiction	Penguin Group (USA) LLC	7590.500	7590.500	37952.50	22771.500	4750	Dutton Children's	big five	4.75

Data Preparation

- 1. No Missing Values
- Valid Zero Values (average rating and total reviews)
- 3. Genres distribution

genre	
children	9.401709
comics	2.101602
fiction	2.712103
foreign language	0.447700
genre fiction	32.941133
nonfiction	52.395752

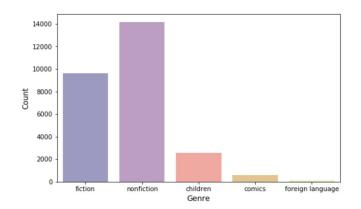

Data Preparation

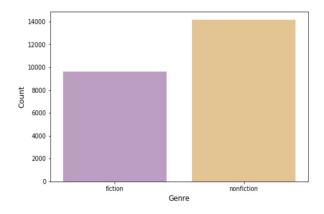

Combine Genres

genre	
children	9.401709
comics	2.101602
fiction	35.653236
foreign language	0.447700
nonfiction	52.395752

Filter Genres

genre fiction 40.492499 nonfiction 59.507501

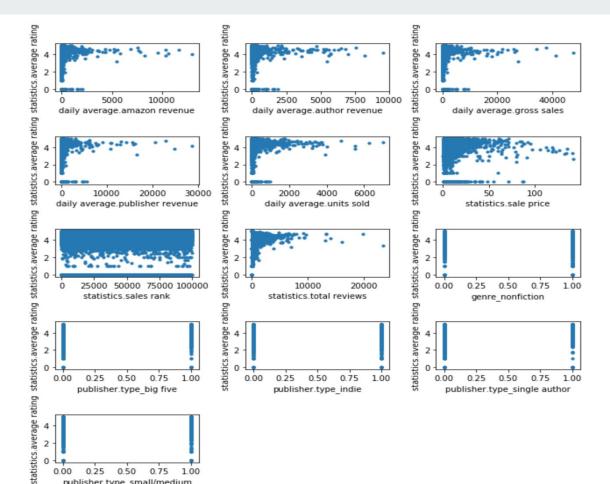

Data Preparation

Categorical Attributes
 sold_by and publisher_name are dropped
 Dummy variables created for publisher_type

Data Modelling

Performance of Regression Models

Classification

Models -

- Basic Decision Tree using the entire feature set
- Basic Decision Tree using a subset of features
- Bagging Ensemble Method with Decision Tree as a base estimator [Best Model]
- Adaboost Ensemble Method with Decision Tree as a base estimator
- Random Forest Ensemble Method with Decision Tree as a base estimator

Data Preparation - Used Scaled Features. Used a subset of features for one model.

Results - Most models came within the 70% bracket for Accuracy, Precision and F1 Score.

Analysis - All models were able to predict genre to around a 70% effectiveness even given our data set's features.

Clustering

Models - Hierarchical Single, Hierarchical Complete, Hierarchical Average, K-Means, DBSCAN

Distance Metrics - Euclidean, Manhattan, Minkowski, Cosine

Data Preparation - Scaling on Features used. Testing on different subsets of data.

Results -

- Low silhouette scores and lower Adjusted Rand. Indices.
- Many singular large clusters.
- DBSCAN 8-10 clusters

Analysis - Values of features common throughout many different types of books - price range, units sold etc. Clusters not ideal for our purposes.

Thank you!
